

MCPA FLOOD RESPONSE

When flooding disrupts households resources, cash assistance becomes a question of delivery, access and outcomes.

The response shows positive movement in household indicators, while delivery gaps remain.

Baseline and follow-up results from the same 60-household panel

WHAT THE EVIDENCE SAYS

- Food consumption status improved between baseline and follow-up.
- Food-related coping decreased over the same measurement period.
- Monthly per-capita economic capacity increased, but adequacy cannot be classified without a contextual MEB/SMEB reference.
- Cash delivery was not complete for all eligible households: 6 received partial transfers and 4 did not receive MPCA.
- Cash access was broadly successful among assisted households, with 53 of 56 reporting successful access.

Interpretation boundary

Two measured points describe change over time. They do not establish causal attribution.

Flooding disrupted livelihoods and household resources, increasing pressure on essential needs.

The simulated response uses MPCA to support vulnerable affected households

THE SHOCK

Flooding

Livelihoods and household resources are disrupted.

HOUSEHOLD PRESSURE

- Difficulty covering food needs
- Pressure on essential household spending
- Need for additional purchasing power

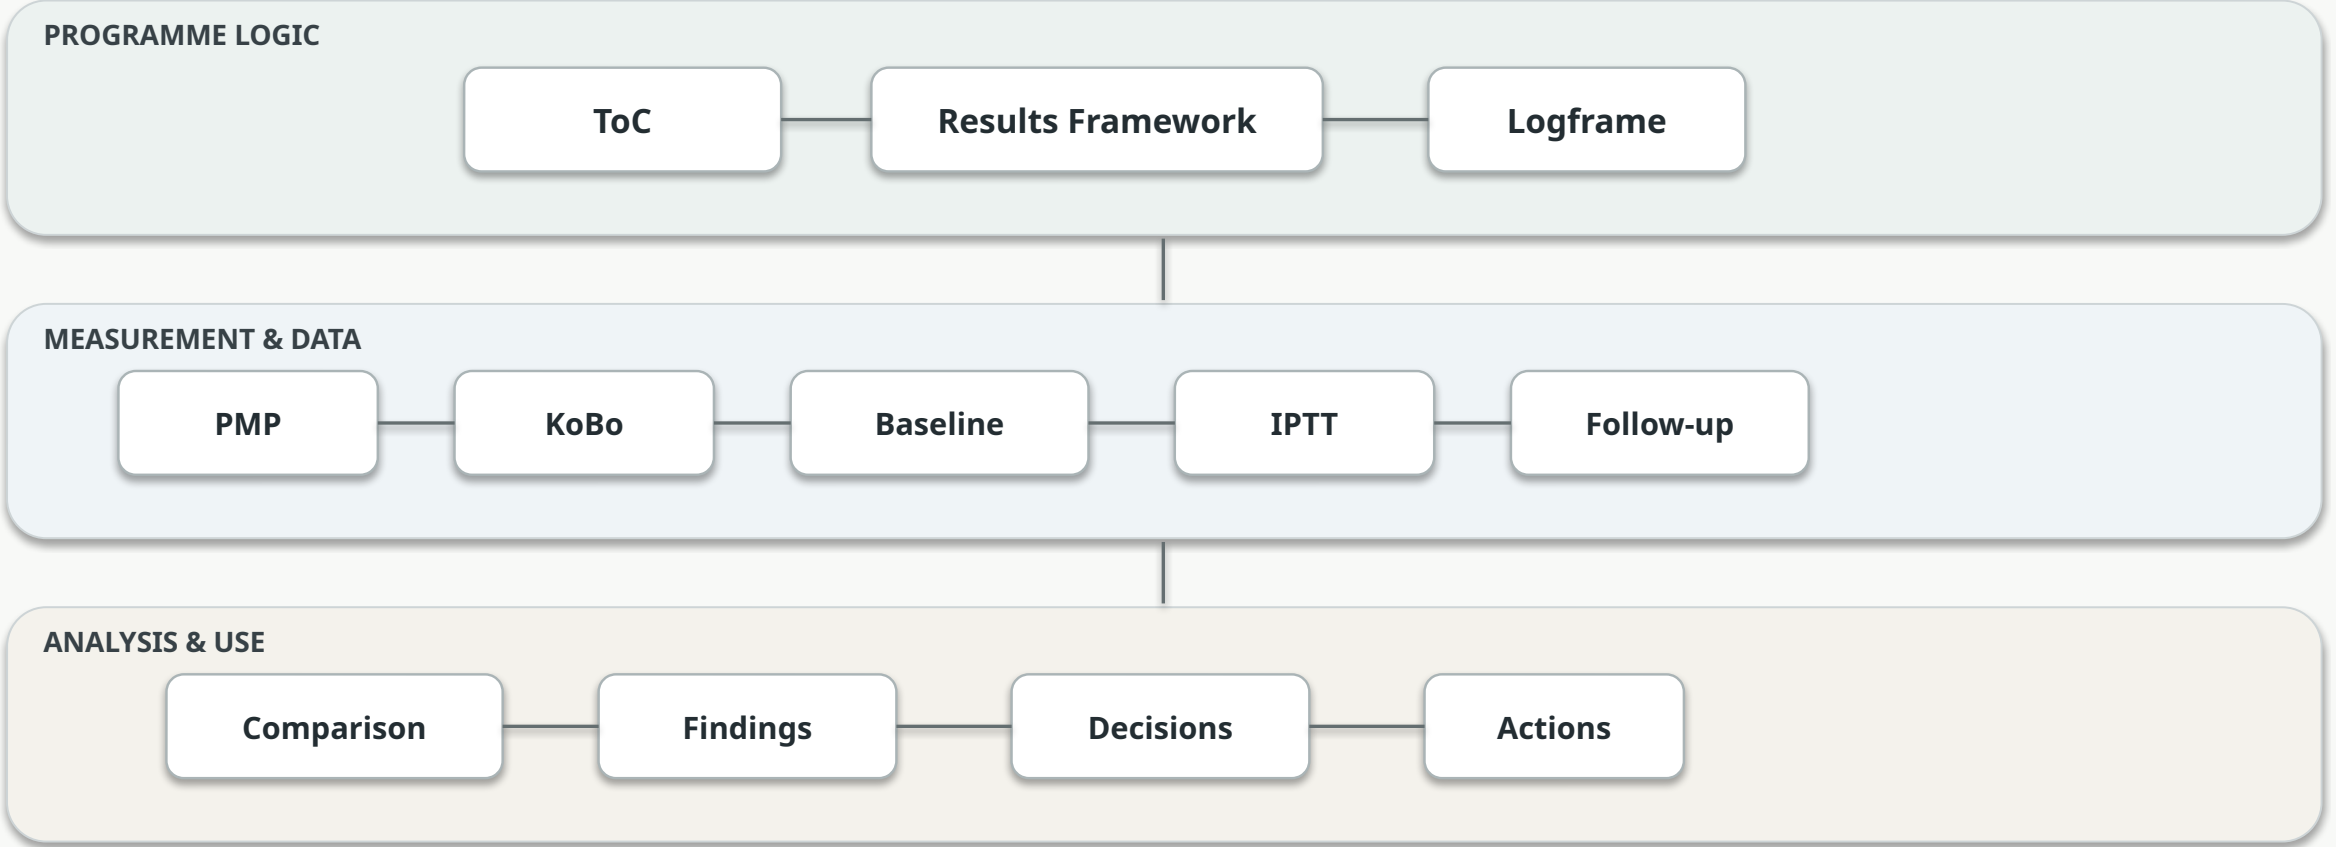

RESPONSE

Multipurpose Cash Assistance

Eligible households receive planned cash assistance so they can access priority needs through functioning markets.

MEAL APPROACH

The monitoring system follows the programme pathway from logic to evidence and action.

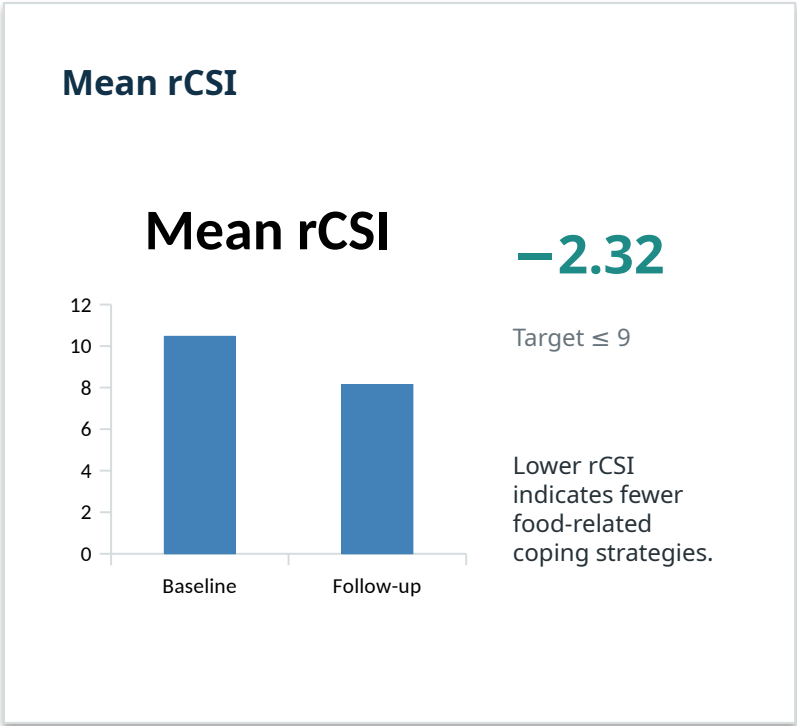

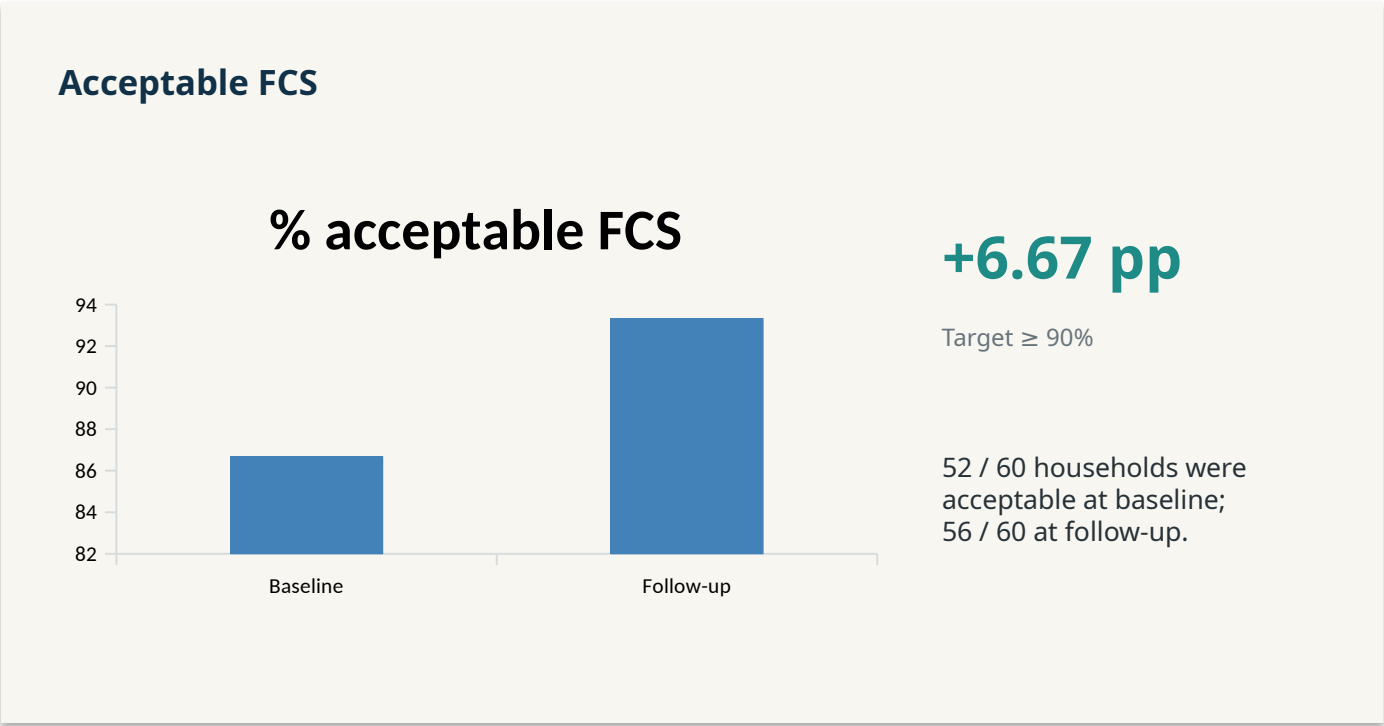

The same evidence base is carried forward so that indicators, interpretation and management actions remain traceable.

The dashboard is the final presentation layer, not the starting point.

Food security indicators moved in a favourable direction.

Same 60-household panel · baseline versus follow-up

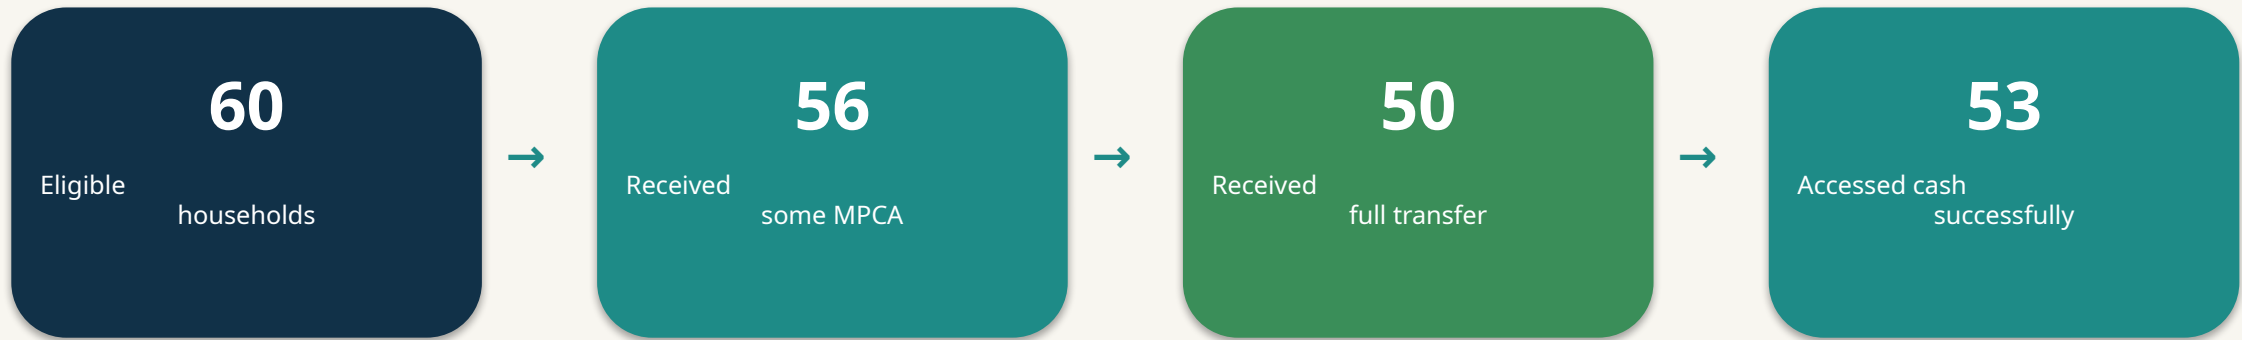

READING THE CHANGE

The observed movement is descriptive. It shows how the measured indicators changed between the two rounds; it does not by itself prove that MPCA caused the change.

Household indicators improved, but cash delivery was not complete for every eligible household.

Operational performance needs to be read separately from outcome movement

6 partial transfers

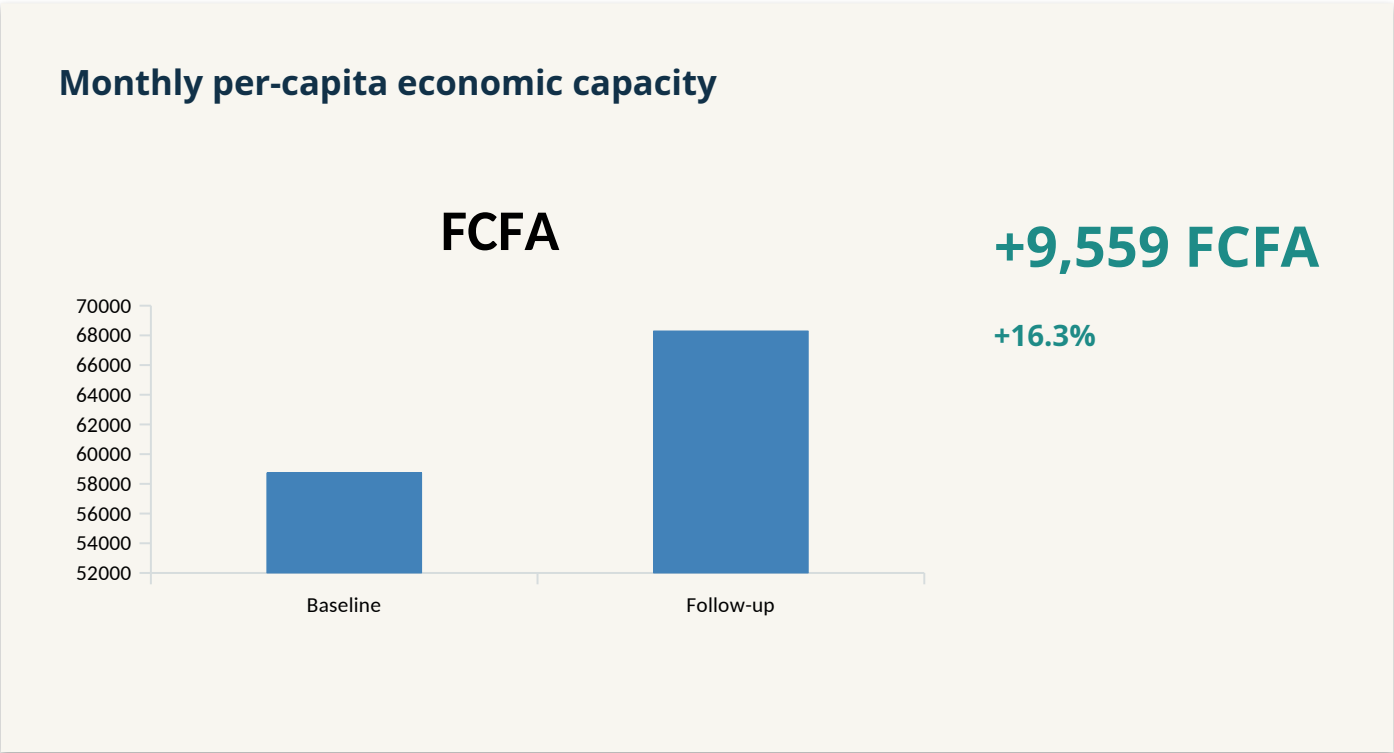

4 eligible households did not receive MPCA

53 / 56 cash-access success · 94.64%

3 of 56 assisted households reported access problems.

Economic capacity increased, but adequacy remains unclassified.

A responsible MEAL reading keeps the missing contextual benchmark visible

Adequacy vs MEB / SMEB

TBD

No contextual threshold is available in the case study.

Next evidence requirement

Obtain and validate the applicable MEB/SMEB reference before classifying adequacy.

The evidence points to both positive movement and operational follow-up.

Stage 09 findings translated into an executive reading

F01	Food consumption status improved	FCS acceptable: 86.67% → 93.33%
F02	Food-related coping decreased	Mean rCSI: 10.47 → 8.15
F03	Economic capacity increased	Adequacy remains unclassified without MEB/SMEB
F04	Full-transfer delivery below target	83.33% versus target ≥ 90%
F05	Cash access broadly succeeded	94.64% among 56 assisted households
F06	Four eligible households did not receive MPCA	56 / 60 received some assistance

Turn evidence into decisions, then make the response traceable to action.

Management actions are presented as proposed follow-up, not observed outcomes

EVIDENCE	MANAGEMENT IMPLICATION	ACTION
83.33% full transfer	Delivery below target	Reconcile 6 partial + 4 non-receipt cases
3 access-problem cases	Investigate barriers to cash access	Review channels, agents and case resolution
58,731 → 68,290 FCFA	Positive movement, adequacy unknown	Obtain / validate MEB or SMEB
Measurement gaps	Some planned indicators cannot be assessed	Restore timeframe, targeting and feedback variables

A credible MEAL system makes its evidence limits visible.

The next cycle should close the gaps that prevent full performance assessment

K03	Economic-capacity adequacy	MEB / SMEB reference unavailable	TBD
K08	Delivery timeframe	Programme-defined timeframe not measured	Measurement Gap
Targeting verification	Output 1 performance	Required denominator / variable not available	Measurement Gap
Communication & feedback	Output 3 performance	Receipt / feedback indicators not captured	Measurement Gap

The absence of a measurement does not mean the programme performed poorly; it means the indicator cannot be responsibly classified.

Close the operational and measurement gaps, then continue the evidence cycle.

A practical next MEAL cycle for the simulated response

- 01

Resolve delivery cases

Reconcile partial transfers and non-receipts; investigate access problems.
-
- 02

Strengthen measurement

Define and capture delivery timeframe, targeting verification and communication/feedback indicators.
-
- 03

Contextualize capacity

Obtain and validate the applicable MEB/SMEB reference.
-
- 04

Continue monitoring

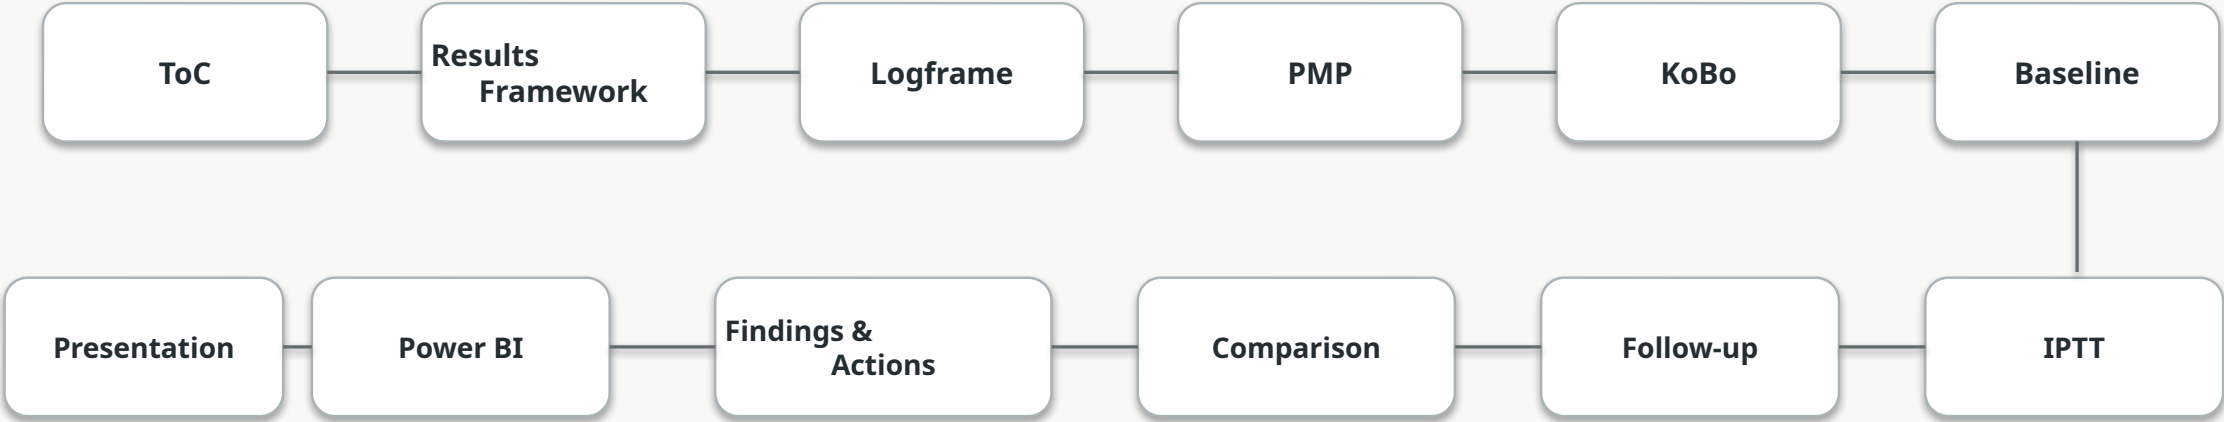

Repeat measurement, update IPTT and compare results across rounds.
-

Portfolio takeaway MEAL connects programme logic, measurement, interpretation and management action.

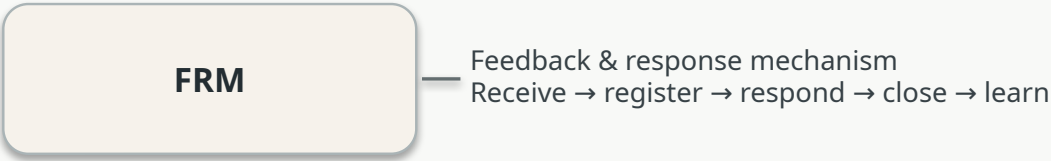

PORTFOLIO ARCHITECTURE

From programme logic to management decision and portfolio presentation.

The case study is supported by a traceable sequence of MEAL deliverables.

COMPLEMENTARY ACCOUNTABILITY

FRM feedback can inform findings, decisions and programme learning.

TRACEABLE MEAL EVIDENCE FLOW · From programme logic to evidence, management action and case-study presentation
