

# RESULTS FRAMEWORK (RF)

MPCA Flood Response | MEAL Portfolio | DPro-aligned | AUDITED & LOCKED

**Purpose.** This Results Framework presents the project's four-level results hierarchy from Goal to Outputs. It translates the project-responsibility portion of the Theory of Change into a clear hierarchy. Detailed indicators, measurement methods, assumptions, operational MEAL procedures and target tracking are developed in the Logframe, PMP / MEAL Plan and IPTT.

| DPro level            | Result statement                                                                                                              |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Goal                  | Vulnerable flood-affected households have improved food security and ability to meet essential needs during the flood season. |
| Strategic Objective 1 | Households have increased economic capacity to access essential food and basic goods.                                         |
| Strategic Objective 2 | Households have improved food security and are better able to meet their food needs during the flood season.                  |
| Intermediate Result 1 | Eligible flood-affected households receive the planned cash assistance in full and on time.                                   |
| Intermediate Result 2 | Assisted households are able to access the cash transfer through a functional transfer mechanism.                             |
| Output 1              | Eligible flood-affected households are identified and verified for MPCA assistance.                                           |
| Output 2              | Verified eligible households are processed for cash assistance through the selected transfer mechanism.                       |
| Output 3              | Households receive information on how to access and use the cash transfer and how to provide feedback or complaints.          |

## Final vertical-logic test

| From      | Meaning                                                      | Logic          | To                                      |
|-----------|--------------------------------------------------------------|----------------|-----------------------------------------|
| Output 1  | identified and verified households                           | supports       | IR1 / IR2                               |
| Output 2  | verified households processed through the transfer mechanism | supports       | IR1                                     |
| Output 3  | households receive access/use/feedback information           | supports       | IR2 and accountable assistance delivery |
| IR1 + IR2 | planned assistance is received and can be accessed           | contribute to  | SO1                                     |
| SO1       | economic capacity / purchasing power improves                | contributes to | SO2                                     |
| SO2       | food security and ability to meet food needs improve         | contributes to | Goal                                    |

**Design decisions retained:** IR1 and IR2 are complementary, not strictly sequential. Output 2 was revised so it represents a project deliverable/process, while IR1 represents the household-level receipt result. Broader external market conditions remain in the ToC/Logframe rather than being forced into RF results. Activities remain in the Logframe, not the RF.

**Alignment status:** RF ↔ audited ToC vertical logic PASSED. **RF STATUS: LOCKED.**
