

THEORY OF CHANGE

MEAL Portfolio Project | Flood Response: Cash Assistance for Flood-Affected Households | Coastal Côte d'Ivoire

Purpose: Explain why and how the proposed cash assistance is expected to contribute to improved food security and ability to meet essential needs among vulnerable households affected by flooding.

Situation / Problem	Intervention	Long-Term Change
Severe flooding disrupts household livelihoods, income sources, assets and normal access to essential goods. Vulnerable households face reduced economic capacity to purchase food and other priority basic goods, increasing the risk of inadequate food consumption and negative coping strategies.	Provide Assistance en espèces à usages multiples (MPCA) to eligible and verified flood-affected households. The assistance is intended to provide additional financial resources, restore part of household purchasing power and support priority essential needs.	Vulnerable flood-affected households have improved food security and ability to meet essential needs during the flood season.

Domain of Change: Household economic capacity and food security

Enabling Preconditions / External Conditions

- Markets remain functional and physically accessible.
- Essential food and priority goods remain sufficiently available.
- Prices remain sufficiently stable so the value of assistance is not substantially eroded.

Critical Assumptions	External Actors / Enabling Environment	How MEAL Will Test the ToC
----------------------	--	----------------------------

• Households are able to access and use the assistance. • Households allocate a meaningful portion of assistance to priority needs. • Markets remain accessible and functional. • Essential goods remain available. • Prices do not substantially erode purchasing power. • No major additional shock overwhelms the intervention.	Payment / financial service providers; market traders and vendors; local authorities and community structures; other humanitarian actors where relevant.	Transfer monitoring; post-distribution monitoring; ECMEN for economic capacity; FCS for food consumption; rCSI for food-related coping; market monitoring for access, availability and prices; follow-up comparison where appropriate.
---	--	--

Portfolio note: This is a simulated project for MEAL learning and portfolio demonstration. The ToC is a living logic model and should be reviewed as evidence, context and implementation experience change.
